Forum Name: NotFinancialAdvice

NotFinancialAdvice will be a website where people would be able to discuss their financial and investment strategies or their predictions for the market. Users would be able to like or dislike posts. The main goal for the website is for more reliable sharing of financial knowledge amongst users. To keep things simple, users who use this website will be reminded that all posts on this website is not financial advice. This is done by showing a disclaimer that this is not financial advice at every page the user visits (or rather have a react component that is always displayed on the page).

Development Plan

I plan to start with a create-react-app with a typescript template so that I can start off with typescript from the beginning. I plan to use golang for my backend as with gin and gorm using go for backend is very manageable. For my database I plan to use Postgres.

I will work on my frontend and test it with faked backend data and then move onto to setting up my Postgres database and finally develop my backend.

Use Cases for my Application (aside from CRUD):

-Users will be able to see their profile page where they can see their own created posts and posts they commented on.

-users would be able to comment on others posts

Extra features I plan to implement:

-create tags for post (have tags about what market they are talking about, tags for if their predictions for market or strategies for investment)

-recommended posts (ranked based on number of likes and dislike)

-allow users to change password
